INFORMATION MANAGEMENT ASSESSMENT

PART 2

1. What goes on during the analysis phase of SDLC?

During the analysis phase, the system requirements are studied and documented. Activities include:

- Understanding the current system
- Gathering requirements from users and stakeholders
- Identifying system problems and opportunities
- Creating requirement specifications
- Modeling the system workflow

2. What are the database activities involved during the analysis phase of SDLC?

Database-related activities include:

- Identifying required data and data sources
- Analyzing existing databases
- Defining entities, attributes, and relationships
- Developing preliminary data models (like ER diagrams)
- Validating database requirements with stakeholders

3. What are being done during the maintenance phase of SDLC?

During maintenance:

- Fixing bugs and errors discovered after deployment
- Updating the system to accommodate changes
- Optimizing performance
- Adding minor enhancements
- Ensuring system security and integrity

4. How does the maintenance phase help continue the cycle of system development?

- Feedback from maintenance identifies new requirements
- Supports iterative improvements
- Ensures the system remains functional and up-to-date
- Helps start the next development cycle if major updates are needed

5. Compare the traditional SDLC with rapid application development (RAD)

Traditional SDLC vs RAD		
Aspect	<u>Traditional SDLC</u>	<u>RAD</u>
Approach	Linear, sequential (Waterfall)	Iterative, fast prototyping
Time	Longer development cycles	Shorter development cycles
Flexibility	Less flexible, harder to change requirements	Highly flexible, easy to adapt to changes
Cost	May be higher due	Can be lower due to early prototyping
User Feedback	Late in the process	Continuous feedback during development
